ganglion cell damage is prominent in an animal model of *Toxoplasma gondii*-induced myelitis. The number of retinal ganglion cells (RGCs) increases up to 1 year after infection with the intracerebral stage of *Toxoplasma gondii* (*T. gondii*). The aim of this study was to characterize the extent of RGC loss in a mouse model of *T. gondii*-induced myelitis. Forty-eight adult, female BALB/c mice were inoculated intrathecally with 3 x 10³ cysts of the ME49 strain of *T. gondii*. Forty-eight control mice were inoculated with the same dose

of brain cysts of ME49 strain. Brain and retina were isolated 1, 2, 4, 8, 16, 24 and 48 weeks after infection. RGCs were counted and the number of RGCs was compared between *T. gondii*- and brain cyst-inoculated mice. Immunohistochemical staining was performed to study the distribution of *T. gondii* in the retina. The number of RGCs was significantly lower in *T. gondii*-infected mice than in the control group as early as 1 week after infection. The number of RGCs in the *T. gondii*-infected group continued to be lower than in the

control group for up to 48 weeks. Parasite antigen could be detected in the retina of mice that were inoculated with the ME49 strain of *T. gondii* 1, 2, 4, 8, 16, 24 and 48 weeks after inoculation, but not in the brains or spinal cords. We demonstrate that a *T. gondii*-induced myelitis has a major effect on the eye and this may be a significant factor in ocular pathogenesis.

Q:
How to set leading zeros in Java
How can I format leading zeros in a date or a number in java? For example if I have a Date object, I want the output to be "Jan 1st 2010".
