A new method of rapid enzyme immunoassay for human serum testosterone. A new method of simple and rapid enzyme immunoassay for human serum testosterone was developed using testosterone 2-O-alpha-D-glucopyranosyl-6-carboxy-7,9,11,14,16-pentaoxohexadecanal as a tracer antigen and a monoclonal antibody produced by cell fusion technique. The tracer antigen had been obtained by derivatization of testosterone with 2,3-O-isopropylidene furanosyl bromide and 2-azido-2-deoxy-alpha-D-glucopyranosyl bromide. Rapid enzyme immunoassay of human serum testosterone was performed on the new tracer antigen, the old tracer antigen and human serum testosterone in the presence of diluents (0.01% Tween 80, 0.01% polysorbate 80, or 0.6% NaCl in double distilled water). With 0.01% Tween 80 and 0.01% polysorbate 80, the sensitive range of this immunoassay was 2.6-130 ng/100 ml of the diluted serum without cross-reactivity with 5 alpha-dihydrotestosterone (5 alpha-DHT). In contrast, with diluents containing NaCl, the method was not sufficiently sensitive because the cross-reaction with 5 alpha-DHT is too strong, the recovery rate is unsatisfactory and an unresponsiveness can be seen in the assay. The response to 100 and 200 ng of 5 alpha-
