The main objective of the Avast Virus Definitions VPS application is to keep the virus definitions files for all products of Avast anti-virus updated, in addition to defining the parameters of this automated process. Users that are not very familiar with this process, can perform the updates themselves using Avast Virus Definitions VPS for free. After the installation, it is possible to select the products that you want to keep updated, as well as the frequency and the update mode. The most recent virus definitions for the selected products are downloaded in the background and stored in the VPS directory on the hard drive. It is possible to set time intervals between the updates, among which the following options are available: - Update all definitions once a week (ideal for business computers) - Update all definitions every day (ideal for personal computers) - Update only when new definitions are released. In addition, there are options that enable the user to customize the updates with the following settings: - The delay between the initial download and the actual update - the actual update occurs only when the definitions have been added to the system. - Adjustment of the number of definitions to download - this option allows the user to customize the number of definitions to be downloaded. - Volume slider - allows the user to manage the volume of the download during the update. - Define the number of definitions to be uploaded - by using this option, the user determines how many definitions need to be uploaded at the end of the process. The actual download process can be performed in the background, with the system not being frozen by the user's intervention. This feature means that it is not necessary to interrupt the use of the computer, thus preventing any undesired impact in its performance. Avast Virus Definitions VPS gives you the possibility to specify the location of the database files and the application will automatically upload them on the computer in which it is installed.
