Password Torrentl. Fluorescence microscopy with cone beam CT for preoperative planning in presurgical orthodontics: A pilot study. The role of intraoperative cone beam computed tomography (CBCT) is increasing in oral surgery. The use of CBCT images for presurgical planning of orthognathic surgery, however, still is of limited value, since it is restricted to planning what kind of operation is needed. Before actual surgery, it could be a better solution to assess precisely the anatomical orientation of the jaw

and to determine the magnitude of surgical movement. The objective of this study was to develop a novel use of CBCT images for presurgical planning of orthognathic surgery. Pre- and post-CBCT scans of 22 patients were reconstructed. Using a custom-developed software, a software module generated 3D models for each CBCT scan. Our system was used to analyse these models as well as conventional computed tomography (CT) scans. 3D models were processed and z-score results were compared with

intraoperative measurements of the soft tissue thickness. Calculating the z-score using the 3D models showed that the 2D soft tissue thickness could be assessed exactly on the CBCT scans. With conventional CT scans, soft tissue values were less accurate. It is possible to calculate the z-score using 3D models. However, there were hardly any differences between CBCT and conventional CT scans. The z-scores varied considerably between patients. No reliable method to assess the thickness of the soft

tissues on CBCT images was found. Furthermore, surgeons have to rely on visual estimation of the soft tissue values. A more precise method of analysis is necessary. The CBCT-based method presented here shows promising results and underlines the advantage of a semi-automated preoperative surgical planning algorithm. Q: How do I debug the middle of a hotfix?
