EasyBar gives you the power to play all your media files with a single interface, and the health of your computer doesn't matter. Q: A function is continuous if and only if is locally Lipschitz Let $C(I, X)$ denote the set of continuous functions $f: I \rightarrow X$, where $I \subseteq \mathbb{R}$ and X is a metric space. For $I = [0, 1]$, $X = [0, 1]$ and $f \in C([0, 1], X)$, we have $d_1(f(x), f(y)) = \sqrt{|f(x) - f(y)|} = d_2(x, y)$ d_1 and d_2 are the distance in \mathbb{R}^2 and \mathbb{R} respectively. I have to prove that $f \in C([0, 1], X)$ is locally Lipschitz if and only if it is continuous. I have proven that f is locally Lipschitz if and only if it is continuous, but I'm struggling to prove the if part, that is if f is continuous, is it locally Lipschitz? A: Let $f: I \rightarrow X$ be a continuous function. Since d_1 and d_2 are equivalent, for any $x, y \in I$ we have $\sqrt{|f(x) - f(y)|} \leq d_2(x, y)$. Consider now a point $x_0 \in I$. Then for all $x \in I$ $\sqrt{|f(x) - f(x_0)|} \leq d_2(x, x_0) = d_1(x, x_0)$. Hence f is locally Lipschitz. HDAC6 inhibition sensitizes chemo-resistant acute myeloid leukaemia cells to TRAIL. Resistance to TNF-related apoptosis-inducing ligand (TRAIL) contributes to chemo-resistance in a wide variety of solid and haematological malignancies. We have shown that cells with high levels of the death inhibitor TRAIL-R1 and low levels of the death receptor TRAIL-R2 are more resistant to TRAIL-induced apoptosis. Consistent with this we have previously demonstrated that the co-expression of TRAIL-R2 with TRAIL-R1 in our myeloid cell lines markedly increases apoptosis induction by TRAIL. This report describes the effect of the dual histone deacetylase (
