compression softwareQ: Rationale for "no set of representatives" axiom for Field extensions The axiom states : If L is a field
extension of K , L contains an element a not in K , and $f(a)$ is in K , then there is a b in L such that $f(b) = f(a)$.
My professor said it had to be the case, and why didn't we find a set of representatives for all of the left cosets of $f(K)$. If we
wanted to find a set of representatives for all of the left cosets of any given group, we'd usually choose one element of each left
coset. But he had no reason for the field extension case. A: Since the ring of integers is a field, 1 is not a unit (normal
element, so it's a zero divisor). Thus -1 in \mathbb{Z} is not a zero divisor, and thus 1 in \mathbb{Z} is not a zero
divisor. Since multiplication by 0 is an endomorphism, it has no non-trivial kernel. Therefore 1 is a unit. A set of
representatives of the left cosets of a subgroup H is not necessarily unique, it depends on whether \dots
